

METERING BAR HOLDER For Paper Industry

METERING ROD COATERS

Metering rod coaters are still widely used due to-

- Simple operation
- Low cost in comparison to other coaters available.

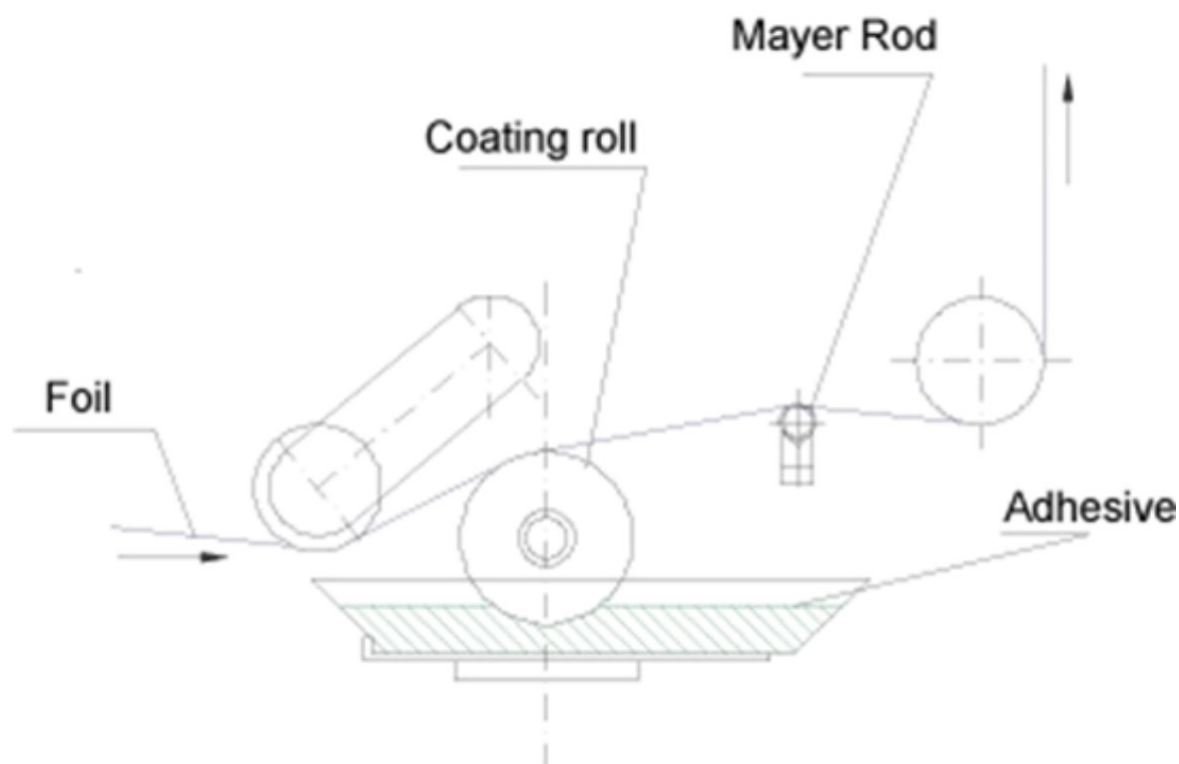

METERING ROD COATER

ADHESIVE COATING EQUIPMENT

Metering rod coater employs pan fed kiss coating role which transfers an excess amount of coating to the foil followed by either a smooth metering rod or wire wound Mayer bar to smooth or meter the coating, as can be seen in the figure below

WHAT ARE METERING RODS?

Metering rods also known as Mayer bars are precision instruments used to accurately meter the amount of liquid coating applied to the paper, film or other substrate.

There are majorly two types of metering bars:

1. **Grooved metering rods:** Excess coating is applied to the substrate prior making contact with metering rod (as shown in slide 3)
2. **Smoothing rods:** It is used as a follow up to the metering rod for smoother coating, specially used in high velocity coating

WHAT IS COATED PAPER?

Papers in which agents are added to fill the tiny gaps between the fibers in order to enhance its surface properties, brightness, smoothness, printing properties, gloss/matte finish etc. are known as coated papers.

ADHESIVE COATING EQUIPMENT

01. Paper Mills

Metering bars are used to control the volume of starch and other coatings.

02. Paperboard Mills

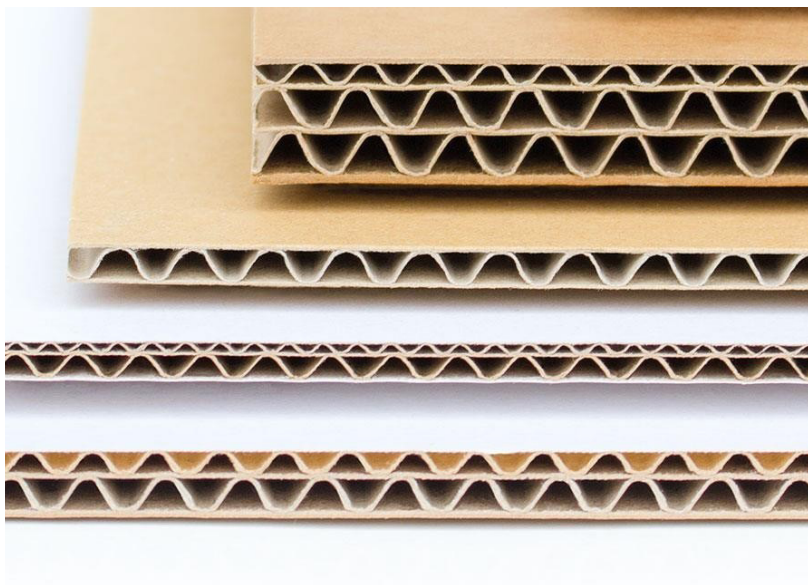

Smoothing rods are used to apply Kalion clay coating on both single and duplex boards to enhance its glossiness and opacity.

03. Linerboard Plants

Metering rods are used to apply variety of colors and other functional coatings such as barrier coating to prevent grease and moisture from penetrating the sheet and white coating prior to printing operations.

04. Converting Plants

Metering rods are used in converting coating operations such as applying adhesive to tape, laying down tint on window film treatment etc.

PLASCON-M METERING BAR HOLDER

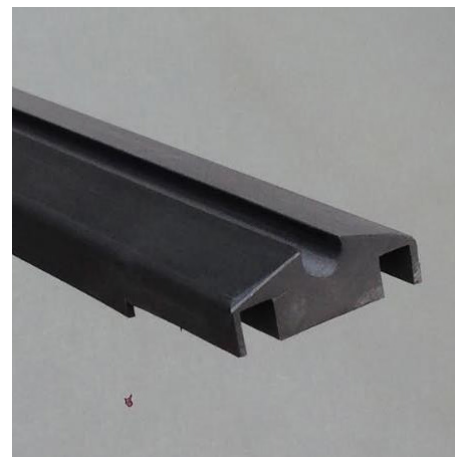

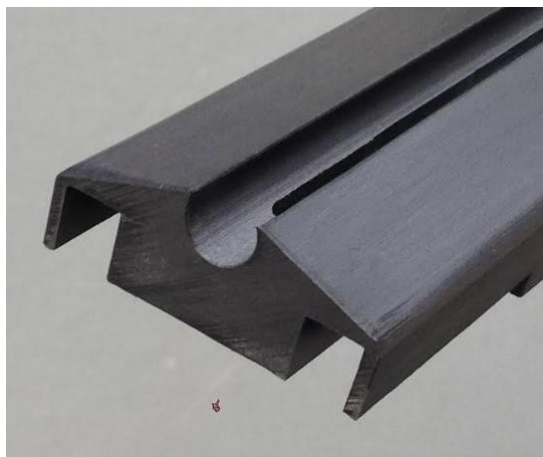

We at KBK Plascon provide UHMWPE metering bar holders under our brand name Plascon-M. Below are some important aspects we take care of in making of our Plascon-M metering bar holders.

CUSTOMIZE: We are capable of manufacturing customised design metering bar holders as per the requirement of our party.

CONSISTENT: With highly specialized equipments and softwares in house, we are able to achieve consistency in our rod holders as per previous supplies.

ACCURACY: Dimensional accuracy is very crucial in metering bar holder, which is ensured by our quality control procedures.

Advantages of Plascon-M Metering Bar

Cost effective for customised shapes: Fabricated from UHMWPE blocks, it does not add any mold or additional tooling cost.

Durable: Harder in comparison with PU holders and lesser coefficient of friction due to special additives in Plascon-M makes it wear resistant hence durable.

Rigid: Stiff/firm Plascon-M holders keeps the surface of the rod cleaner during operation, specially advantageous for smooth rods.

Weather & Chemical resistant: Being weather resistant it won't break down like rubbers do. Also being chemical resistant makes it preferable for any kind of coating.

Long Life: Wear Resistance, chemical resistance, weather proofing, higher load bearing capability & apt hardness makes leads to longer life of Plascon-M metering bar holders.
