

SOLUTION FOR HEADBOX IN PAPER MACHINE

HEADBOX AND ITS FUNCTION

The headbox in paper formation machine is an equipment that distributes the paper making stock uniformly across the width of the wire section.

- It is responsible to generate satisfactory formation.
- Distributes the flow equally in Cross Direction.
- Also manages accurate fiber concentration as per varying speed.

PRODUCTS FOR HEAD BOX

- Diffuser block/Manifold plate/Distribution Block
- Perforated Disc / Distribution Disc
- Distribution Tube/Distribution Nozzle/Diffuser Tube

Which type of Headbox uses Diffuser plate/ Manifold Plates/Distribution Block

- Depending on the type of the headbox, flow stabilisation element (manifold plate in our case) can be roll, tube or plate with even holes.
- Depending on the design these elements are present inside the headbox.
- Plascon Manifold Plates are use in hydraulic type headboxes

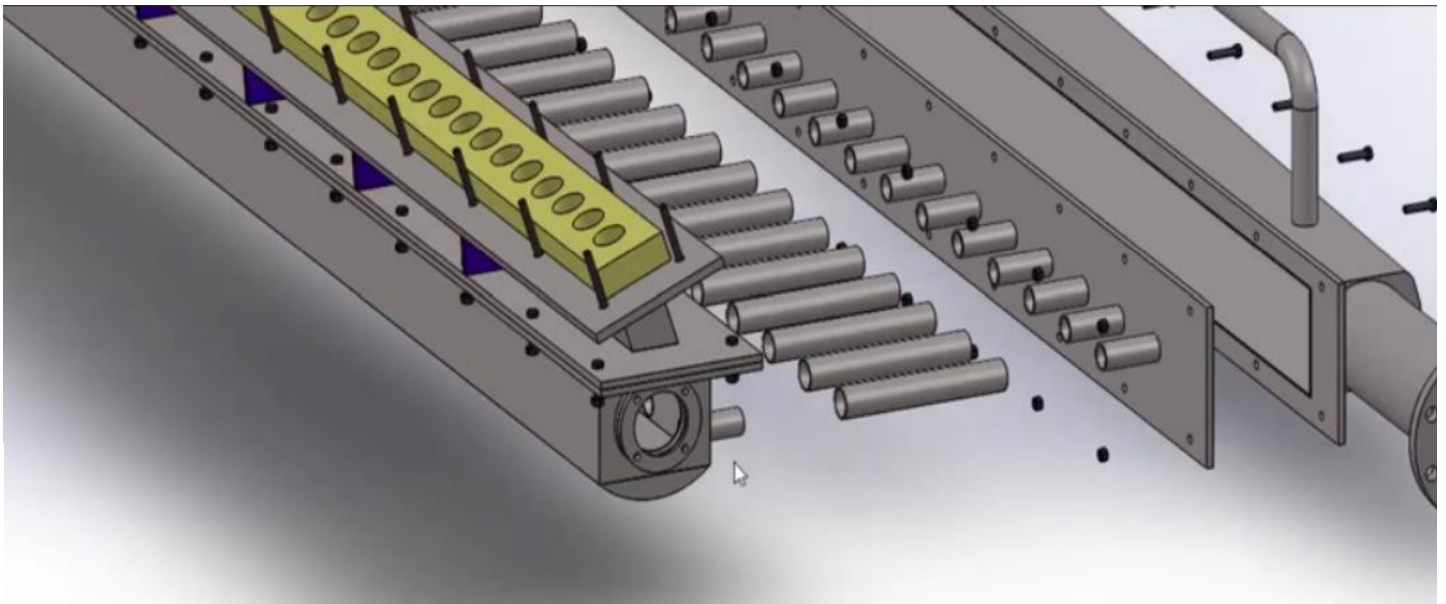

Fig 4: The yellow part is the Diffuser block/Distribution plate/
Manifold Plate, its size varies from headbox to headbox.

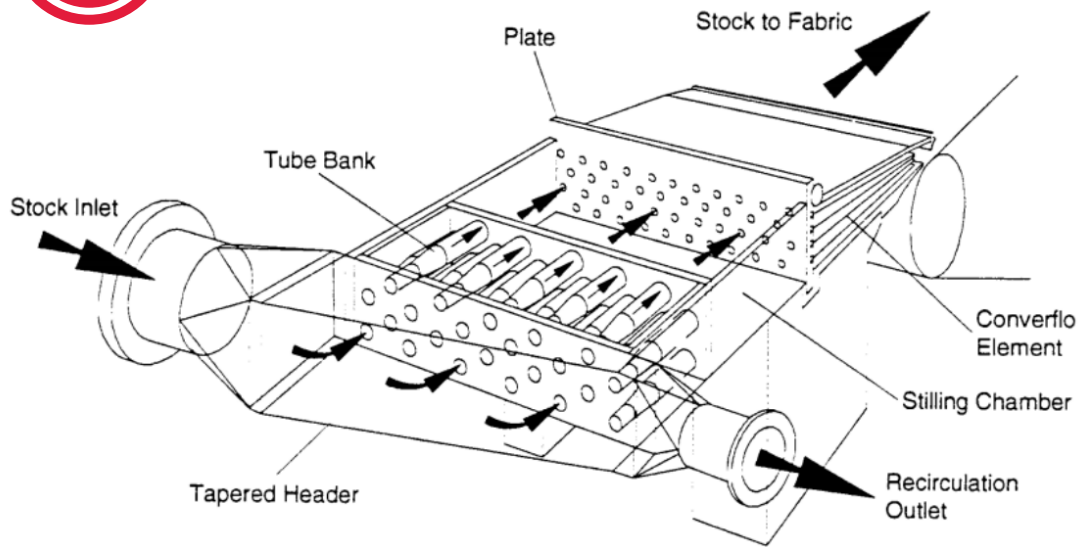

Fig 5: The plate marked in the figure above is Plascon Manifold Plate in hydraulic type headbox. Its position will vary as per design of the headbox.

Diffuser Plate/Manifold Plate/DistributionBlock and its Application

Plascon Diffuser Plate /Manifold Plate in the headbox is responsible for flow spreading hence also known as flow stabilisation elements.

- It prevents the fiber from settling in the lump form
- It regulates the pressure to achieve good cross directional basis weight profile.
- It prevents large scale turbulence which can cause unevenness in the paper.

DIFFUSER BLOCK/ MANIFOLD PLATE

We manufacture Diffuser block in 3 Grades ,Namely PLASCON-V,PLASCON-H & KAYLON. We can manufacture Diffuser Block upto 10 m Length in Single Pc Upto 250 mm in thickness and maximum 450 mm Width.

Depending on Application and dimensions the MOC of Diffuser Block can be finalised.

PLASCON-V AND PLASCON-H

- Plascon grades offer and outstanding price-performance Ratio
- Excellent Wear Resistance
- Excellent Chemical Resistance to Acids and Bases
- Zero Water/Moisture Absorption
- Can be - in single Lengths of 10 m

KAYLON

- Kaylon offers outstanding Surface Finish
- Reduced Thermal Expansion
- Anti Adhesive Effect

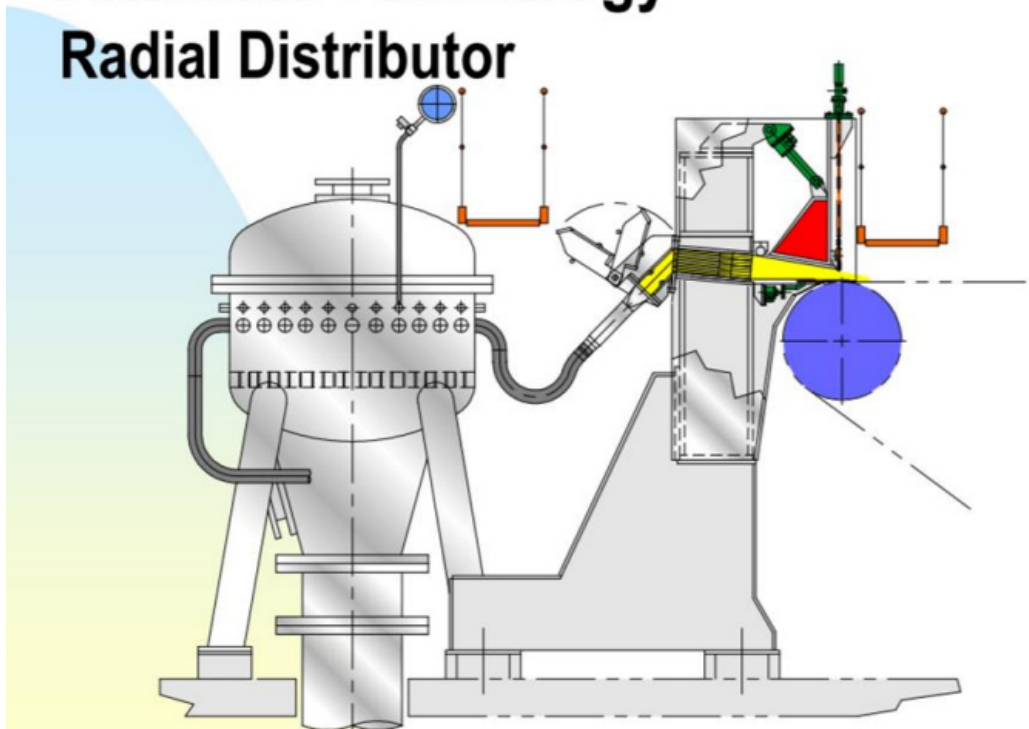

PERFORATED DISC/DISTRIBUTION DISC

We manufacture Diffuser block in 4 Grades ,Namely PLASCON-V, PLASCON-H, KAYLON and Paketal

Perforated Plates upto 2000 mm possible in Kaylon in single pc, in all the other materials possible with mechanical joints which works very well

Alternate Technology Radial Distributor

DISTRIBUTION TUBE/DISTRIBUTION NOZZLE/ DIFFUSER TUBE

Distribution Tube made from high-quality Paketal material offers with excellent surface properties.

It also provides excellent flexibility as the flow design of the tubes can be changed without changing the basic Diffuser block.

Old worn out diffuser blocks can be reused by just changing the distribution tubes.

ADVANTAGES

- Flawless surface quality
- Good chemical resistance
- No water absorption
- High level of rigidity
- Can be changed easily

HYDRAULIC HEADBOX VIDEO

- Right click on the link below then press open hyperlink, which will direct you to 1:14 min video of Dynaflow hydraulic headbox.
- In the video, you will see how the stock flows in the headbox and the manifold pattern can be clearly seen as well.
- You may also try pressing the link directly and if that does not work then simply copy paste it in YouTube.
- Link: <https://www.youtube.com/watch?v=JYkiJvggQkc>

HIGHLIGHT & MARKETING ADVICE

- The key purpose of these Plascon solutions for headbox is to smoothen the flow of pulp for satisfactory formation, for which it is important that the surface finish and holes of these plates, discs and nozzles are smooth and flawless.
- Hence while marketing these products, it is important to highlight the best machining and surface finish we offer, which helps in preventing flocking or any sort of hindrance in smooth flow of the pulp.
- When we talk specifically about distribution tubes (nozzles), they are very useful in making the old diffuser blocks usable, as these tubes (nozzles) can be inserted in the holes of diffuser blocks to make the flow of pulp smooth again.
- We can refinish the old diffuser blocks along with diffuser tube (nozzle) solution.
